L09 — Live Demo Runbook

Claude artifact workflow with offline fallback

GenAI Basics · Module 09 · 2026-09-08

Demo goal

Show students that a good artifact workflow is brief-driven and test-driven. The demo produces a support-ticket triage dashboard from a small CSV. The learning value is in inspecting and revising the artifact, not in pretending the first output is production-ready.

Prerequisites

- Claude.ai or Claude Desktop account with code execution and file creation enabled, when available.
- Sample file: demo_assets/support_tickets.csv.
- Local fallback: demo_assets/artifact_prototype.html, which can be opened in any browser.
- No real customer data. Do not paste private tickets into a live demo.

Demo sequence

Step	Action	Expected teaching point
1	Open support_tickets.csv and describe the scenario.	Students see the data columns before seeing the artifact.
2	Paste weak prompt: “Make a dashboard for these tickets.”	Attractive output may lack operational tests.
3	Paste strong prompt from prompts.md.	A product brief produces a more inspectable artifact.
4	Inspect P1 stale tickets, owner load, open/closed status, and missing-value handling.	Testing is visible and concrete.
5	Ask for targeted revision: “Move stale P1 tickets above the fold and add a plain-language explanation.”	Revision should be tied to a failure, not taste.
6	Discuss publish/share/export decision.	Sharing is a governance decision, not just a UI click.
7	Open local fallback if Claude is unavailable.	Class can still practice acceptance tests.

Strong demo prompt

Create a Claude Artifact: a single-page support triage dashboard for the attached CSV. The user is a support lead who has three minutes each morning. Show summary KPIs, stale P1/P2 warnings, a filterable ticket table, owner workload, and a short “what to act on first” section. Do not expose emails or private customer

notes. Use no external libraries. Acceptance tests: every P1 ticket older than two days must be visible above the fold; tickets with missing owners must be called out; the page must still be usable if JavaScript is disabled enough to read the core table.

Fallback path

- Open demo_assets/artifact_prototype.html in a browser.
- Ask students to run the acceptance tests manually.
- Use the fallback HTML as “Claude’s first draft” and ask students to write revision instructions.
- Do not explain the fallback as a failure; frame it as a professional demo safety net.

Cleanup

- Close any public sharing dialogs without publishing.
- Delete throwaway conversations if any sensitive accidental input was pasted.
- Leave the local fallback files unchanged for the next class.
